Abstract

Two nickel(II) and cobalt(II) complexes with phenanthroline, [Ni(Phen)(H_2O)$_3$Br]Br (**1**) and [Co(Phen)$_2$(H_2O)$_2$](Hba)$_2$·2H_2O (**2**), Phen = 1,10-phenanthroline and Hba^- = barbiturate anion, were synthesized and characterized by powder XRD, TGA and FT-IR. Their structures were determined by single crystal X-ray diffraction techniques. The Ni^{2+} ion is coordinated by two N atoms of Phen molecule, Br^- ion and two H_2O molecules forming octahedron. Uncoordinated and coordinated Br^- ions are connected with water molecules by O—H···Br intermolecular hydrogen bonds with the formation of 2D plane network which by π−π stacking interactions are extended into a 3D network. The [Co(Phen)$_2$(H_2O)$_2$]$^{2+}$ cation contains a six-coordinated cobalt atom chelated by two Phen ligands and two aqua ligands in *cis* arrangement. N—H···O, O—H···O and C—H···O intermolecular hydrogen bonds form a 3D net. N—H···O hydrogen bonds form the infinite chains of Hba^-. Also, coordinated Phen molecules and lattice water molecules are linked *via* C—H···OW hydrogen bonds to form infinite zigzag chains. These two alternating chains are connected by OW—H···O hydrogen bonds. π−π interaction plays an important role in the structures **1**-**2** stabilization. FT-IR and TGA were also used to characterize these compounds.

Keywords: nickel; cobalt; barbituric acid; 1,10-phenanthroline complexes; X-ray diffraction; thermal decomposition; infrared spectroscopy

1. Introduction

Mixed-ligand metal complexes containing 1,10−phenanthroline (Phen) play an important role in analytical chemistry, catalysis [1], biology [2] and magnetochemistry [3]. Phen used as auxiliary ligand is excellent candidate for the construction of novel mixed-ligand complexes, since it can forms strong bonds with metal ions, and act as a hydrogen bond donor and acceptor, and the pyridine rings can interact to each other or other molecules with π–π stacking interactions [4]. Like hydrogen bonding, the π–π interaction plays an important role in molecular recognition and self-assembly processes in the solid state, and significantly influences the properties of many materials. Cationic complexes of transition metals containing 1,10-phenanthroline and other π-conjugated ligands of special interest because they can be formed solid-state structures with abundant supramolecular architecture and with potentially useful properties, for example, the metal complex $[Co(Phen)_2(H_2O)_2]^{2+}$ has high catalytic activity in the hydroxylation of phenols [5]. We describe here the synthesis and structures of two new mixed-ligand complexes, $[Ni(Phen)(H_2O)_3Br]Br$ (**1**) and $[Co(Phen)_2(H_2O)_2](Hba)_2{\cdot}2H_2O$ (**2**), where, Hba^- = barbiturate anion. Barbituric acid (H_2ba) and their derivatives are important groups of sedative/hypnotic drugs. On the other hand, the non-covalent interactions, such as hydrogen bonding and π–π stacking, are of great importance in the chemistry of barbiturate compounds [6].

2. Experimental section

2.1. Reagents and synthesis

1,10-phenanthroline monohydrate (CAS number: 5144-89-8) and barbituric acid (CAS number: 67-52-7) with the a purity of ≥98% were commercially available from Sigma-Aldrich. $CoCO_3$ and $NiCl_2{\cdot}6H_2O$ were obtained as a reagent analytical grade (Acros) and they were used without additional purification also. 2.5 mmol (0.59 g) $NiCl_2{\cdot}6H_2O$ was dissolved in 5 M LiBr (5 cm^3), then a solid $Phen{\cdot}H_2O$ (0.5 mmol, 0.099 g) was added to the resulting solution. The mixture was kept at 90 ºC for 15 min in a water bath and, then, it was filtered. The resulting filtrate was left at room temperature for slow evaporation of water. The solution pH was equal to 6 (a multitest IPL-103 pH meter, Semico, Russia). Two days later, the green crystals of **1** were precipitated from the volume of the solution ≈4.5 ml, which were filtered off and dried in air to a constant mass. The yield was 24% (0.054 g) on based Phen. A single crystal for the X-ray

diffraction analysis was taken directly from the total mass of the product. The elemental analysis for $C_{12}H_{14}Br_2N_2NiO_3$ (**1**): Calc.: C, 31.8%; H, 3.12%; N, 6.19%. Found: C, 31.4%; H, 3.38%; N, 6.07%. Compound **2** were prepared by the neutralization of barbituric acid with the cobalt(II) carbonate in an aqueous solution with subsequent addition of phenanthroline monohydrate. 0.78 mmol (0.10 g) barbituric acid was mixed with 0.39 mmol (0.046 g) $CoCO_3$ in water (5 cm^3) and stirred for 3h at 90 ºC, then a solid Phen·H_2O (0.78 mmol, 0.155 g) was added to the resulting mixture under stirring. Light orange solution (pH 6) was slowly cooled and allowed to evaporate at room temperature. A one day later, light orange crystals of a cubic shape were precipitated. The crystalline product was filtered off and dried between sheets of filter paper in air at room temperature. The yield was 28% (0.082 g) based on Phen. A single crystal for the X-ray diffraction analysis was directly selected from the total mass of the precipitate. The elemental analysis for $C_{32}H_{30}CoN_8O_{10}$ (**2**): Calc.: C, 51.6%; H, 4.06%; N, 15.0%. Found: C, 51.1%; H, 4.20%; N, 14.7%.

2.2. X-ray diffraction analysis

The intensity patterns were collected from single crystals **1** and **2** at 100 K using a D8 Venture X-ray single crystal diffractometer (Bruker AXS) equipped with a CCD-detector, graphite monochromator and a Mo Kα radiation source. The absorption corrections were applied using the SADABS program. The structures were solved by the direct methods using package SHELXS and refined in the anisotropic approach for non-hydrogen atoms using the SHELXL program [7]. All hydrogen atoms were found *via* Fourier difference maps. Then, the hydrogen atoms, which are linked with C,N atoms in the Hba^-, $PhenH^+$ ions, were positioned geometrically as riding on their parent atoms with d(C–H) = 0.93-0.98 Å, d(N–H)=0.86-0.89 Å depending on geometry and $U_{iso}(H) = 1.2U_{eq}(C,N)$. All hydrogen atoms of the H_2O molecules were refined with bond length restraint d(O–H) = 0.9 Å and $U_{iso}(H) = 1.2U_{eq}(O)$. The structure test for the presence of missing symmetry elements and possible voids was produced using the PLATON program [8]. The DIAMOND program is used for the crystal structure plotting [9].

The powder X-ray diffraction data of **1** and **2** were obtained at room temperature using a diffractometer D8 ADVANCE (Bruker) equipped by a VANTEC detector with a Ni filter. The measurements were made using Cu Kα radiation. The cell parameters defined by a single crystal analysis were used as a base in powder pattern Le Bail fitting, but obtained final parameters were slightly bigger (Table 1S) due to different temperatures of single crystal experiment (100 K) and powder diffraction experiment (300 K). The refinement was produced using program TOPAS 4.2 [10]. The low *R*-factors and the good refinement results shown in (Fig. 1S, Table 1S) indicate

the crystal structures of the powder samples to be representative ones of the (**1, 2**) bulk structure, respectively.

2.3. Physical measurements

TGA was carried out on the simultaneous SDT-Q600 thermal analyzer (TA Instruments, USA) under the dynamic air atmosphere (50 ml/min flow rate) within 25–850 °C at the scan rate of 10 °C/min. The qualitative composition of the evolved gases was determined by FT-IR spectrometer Nicolet380 (Thermo Scientific, USA) combined with a thermal analyzer and with the TGA/FT-IR interface (attachment for the gas phase analysis). This set up allows simultaneous accumulation of the DTA/TG data and the released gas composition. The compound weight was 13.168 mg for **1** and 8.646 mg for **2**. Platinum crucibles with perforated lids were used as the containers. The IR absorption spectra of the compounds inserted into the KBr tablets were recorded over the range of 400–4000 cm^{-1} at room temperature on an FT-IR spectrometer Nicolet 6700 (Thermo Scientific, USA, SFU CEJU). The chemical analysis was carried out with an HCNS-0 EA 1112 Flash Elemental Analyser.

3. Results and discussion

3.1. Crystal structures of 1

The unit cells of [Ni(Phen)(H_2O)$_3$Br]Br (**1**) correspond to monoclinic symmetry. Space group $P2_1/c$ was determined from the statistical analysis of the reflection intensities. The main crystal data are shown in Table 1. The asymmetric unit of complex **1** contains one Ni^{2+} ion, one Phen molecule, three H_2O molecules and two Br^- ions (Fig. 1a). The Ni^{2+} ion is coordinated by two N atoms of one Phen molecule, one Br^- ion and two H_2O molecules forming octahedron. This mixed-ligand [Ni(H_2O)$_3$PhenBr]$^+$ complex is connected with outer sphere Br^- ion by one O—H···Br hydrogen bond with outer sphere Br^- ion in the asymmetric part of unit cell. So far, the structure of 27 complexes, containing [Ni(Phen)(H_2O)$_3$X] unit, where, X = H_2O or other O-, N- and S-donor ligands, has been determined. As in **1** and **2**, in these compounds 1,10-phenanthroline coordinates with metal atoms in chelating modes *via* two N atoms [10]. In (**1**) the Ni—O1 and Ni—O3 bond lengths are 2.054(2) and 2.055(2) Å, while the Ni—O2 distance bond that is *trans* to the Br atom is slightly longer then other (2.097(2) Å). The Ni—N distances are 2.061(2) and 2.063(2) Å, with a chelating N1—Ni—N2 bond angle of 81.02(7)º. These bond lengths and angles fall within the ranges observed in complexes containing [Ni(Phen)(H_2O)$_3$X] units (CSD refcode HICYOI]) [11]. The length of the Ni—Br bond is 2.5759 (3) Å, that is, it also has the usual value [10]. The main bond lengths C—N, C—C, C—O (Table 2S) and the

angles are in a good agreement with other related compounds of Phen (CSD refcodes HICYOI, KEBFEC, IYULET) [11-13].

There are six O—H···Br intermolecular hydrogen bonds in the structure (Table 3S), and all H atoms of all H_2O molecules are involved in them. Outer sphere Br^- ion is connected by O—H···Br1 hydrogen bonds with four water molecules from different $[Ni(H_2O)_3PhenBr]^+$ cations. The coordinated Br^- ion forms two weak O—H···Br2 hydrogen bonds. These hydrogen bonds form 2D plane network in *bc* plane with the shortest ring motifs $R_4^2(8)$, $R_3^2(10)$, $R_4^2(10)$ (Figure 2a). The Phen molecules are not involved in hydrogen bonding. However, they combine $[Ni(H_2O)_3PhenBr]^+$ cations into pairs by π-π interactions (the head-to-tail type) between neighboring Phen rings (Table 4S, Fig. 2Sa) in resulting the 2D layers are extended into a 3D supramolecular network. Topological analysis of the net, using simplification that $[Ni(H_2O)_3PhenBr]^+$ is first node and another Br atom is second node, revealed that this is 2-nodal (4-c)(8-c) net with point symbol $(3^3.4^3)(3^6.4^{13}.5^6.6^3)$ and 4,8L38 label which was previously observed in four metal-organic compounds with refcodes: AFAYEL; KEBFAY; PARKOK; WEVNAN [15]. It should be noted that AFAYEL (Triaqua-(2,2'-bipyridine)-(nitrato)-manganese(II) nitrate) has similar local structure, but phenanthroline molecule should be replaced by bipyridine and Br^- ion should be replaced by NO_3^- ion. In addition **1** and AFAYEL ($P2_1/c$, a = 11.5797 (5), b = 9.5007 (4), c = 14.8683 (6) Å, β = 107.899 (1)º) have similar cell parameters and the same space group, proving their similarities. The KEBFAY compound isostructural to AFAYEL, but Mn^{2+} ion was replaced by Ni^{2+}.

3.2. Crystal structures of (2)

The unit cells of $[Co(Phen)_2(H_2O)_2](Hba)_2{\cdot}2H_2O$ (**2**) also correspond to monoclinic symmetry. The main crystal data are shown in Table 1. The asymmetric unit of complex (**2**) contains half Co^{2+} ion, one Phen molecule, one Hba^- ion, one coordinated water and one crystallized water molecule (Fig. 1b). In $[Co(Phen)_2(H_2O)_2]^{2+}$ cation, the Co^{2+} ion is coordinated by four N atoms from two Phen molecules, and two H_2O molecules forming octahedron. The barbiturate ions do not coordinate to metal ion. As in all compounds containing $[Co(Phen)_2(H_2O)_2]^{2+}$ cation, two coordinated water molecules is situated in a *cis* position with an O1W—Co—$O1W^i$ angle of 87.00 (11)º, and the coordination around the Co atom is a distorted octahedron, expected because of the presence of two rigid Phen ligands [16−18].

A dihedral angle between Phen molecules coordinated to one Co atom is 71.05(3)º. The Co—OW bond lengths are 2.106 (2) Å, while the Co—N distances bond are of 2.130(2) and 2.121 (2) Å, with a chelating N1—Co—N2 bond angle of 78.22 (9)º. The Co—N bond distances are similar to the Co—N bond lengths in high-spin Co(II) complexes. The low-spin complexes

contain shorter Co—N distances of about 1.97(4) Å [19]. In $[Co^{III}(Phen)_2(H_2O)_2](NO_3)_3 \cdot 2H_2O$ the Co—N bond distances even shorter are of 1.933 and 1.935 Å [16]. The main C—O, C—N, C—C bond lengths and the angles in **2** (Table 2S) coincide with those found earlier in other related compounds containing Phen molecules [17, 18] and uncoordinated Hba^- ions [20–21].

There are eight N—H···O, O—H···O and C—H···O intermolecular hydrogen bonds, in the structure (Table 3S) which form a 3D net. N—H···O hydrogen bonds form the infinite chains of Hba^- along the *a*-*b* direction based on the $R_2^2(8)$ pattern (Fig. 2b). In addition, the Hba^- ion is connected to the coordinated water molecule of each of the two $[Co(Phen)_2(H_2O)_2]^+$ cations by OW—H···O hydrogen bond. In turn, $[Co(Phen)_2(H_2O)_2]^+$ cation is bound to each of the two Hba^- ligands by OW—H···O hydrogen bond with the closure of the 8-membered ring ($R_3^2(8)$ motif). Crystallization water molecules combine cations by hydrogen bonds C—H···OW into an infinite chain along the c-axis with formation of the supramolecular $R_4^2(20)$ motif. At that, each of them is connected with two molecules Phen belonging to different Co atoms. The chains of $[Co(Phen)_2(H_2O)_2]^+$ cations alternate with zig-zag chains of Hba^- ions, and they are bound together by OW—H···O hydrogen bonds. As in complex **1**, the cations are united into pairs by π–π interaction between neighboring Phen rings of a head-to-tail type (Table 4S, Fig. 2Sa). In addition, each of these Phen molecules is connected by π–π interaction with one Hba^- ion. Topological analysis using ToposPro program [15] showed that this 3D net is 3-nodal $(3\text{-c})_2(7\text{-c})_2(10\text{-c})$ net with point symbol $(3^5.4^{10}.5^7.6^{19}.7^4)(3^5.4^6.5^3.6^7)_2(4^2.6)_2$ which is new.

3.3. IR spectroscopy

The IR spectra of **1** and **2** are significantly different from the spectra of starting materials (Fig. 3S–4S) and this indicates the formation of new compounds. In the analysis of the IR spectra, the results of earlier studies were used for comparison [18, 21, 22, 23]. In the IR spectrum of compound **1** (Fig. 3S, curve 2), a broad band centered at 3332 cm^{-1} is assigned to the ν(OH)) stretching vibrations of coordinated water molecules [23]. Vibration bands in IR spectra of **1** centered at 1622, 1583, 1515, 1426 and 1344 cm^{-1} indicate the presence of 1,10-phenanthroline. In the IR spectrum of compound **2** (Fig. 4S, curve 3), a band at 3626 cm^{-1} is assigned to the ν(OH) vibrations of water molecules and a medium broad band centered at 3160 cm^{-1} is assigned to the ν(NH) stretching vibrations of Hba^- ions. The band with a frequency 1655 cm^{-1} can be assigned to the stretching mode of CO in Hba^- ion [21, 22]. Peaks at 426 cm^{-1} in the IR spectra of **1** and **2** were attributed to the M—N stretching vibrations [18].

3.4. Thermal decomposition

Thermal decomposition of compounds **1** and **2** started with the release of water molecules. In compound **1**, an experimental weight loss (Δm) of 10.2% are observed between 75 and 150 ºC (Fig. 5S), which corresponds to the release of the coordinated water molecules (−3H_2O, Δm_{theor} =11.9%). The dehydration is accompanied by an endo effect at 119.2 ºC. The water removal was confirmed by the IR spectroscopic analysis of released gases. According to TG curve, a plateau is reached at approximately 150 ºC (Fig. 5S). The weight of sample **1** remains unchanged up to ~450 ºC , and there are no peaks in the DSC curve below this temperature. Compound **1** melts with the decomposition at T > 450 ºC. These processes are accompanied by a weak endo effect at 459.1 ºC and a strong exo effect at 706.3 ºC. According to the IR spectroscopic analysis of the gases evolved at T > 450 ºC, CO_2, CO and HCl are formed. At 800 ºC, the final product consists mainly of nickel oxide NiO. The total experimental weight loss was found to be 85.9%, which is bigger than that calculated for the transformation of **1** to NiO (Δm_{theor} = 83.5%), the difference may be due to the impurities in the analyzed sample and thermolysis product.

The DSC and TG curves of $[Co(Phen)_2(H_2O)_2](Hba)_2{\cdot}2H_2O$ (**2**) show two-step dehydration (Fig. 6S) which is accompanied by two endo effects at 98.0 ºC and 180.7 ºC. The first dehydration stage proceeded in the range of 70−140 ºC which corresponds to the release of two lattice water molecules with Δm = 4.3% (−2H_2O, Δm_{theor} = 4.8). The second dehydration stage in the range of 150−200 ºC showed Δm = 4.2 (−2H_2O, Δm_{theor} = 4.8%). It corresponds to the release of the coordinated water molecules. Two-step water removal was confirmed by IR spectroscopic analysis of the released gases. At 800 ºC, the final product consists mainly of cobalt oxide Co_3O_4. The total Δm was found to be 87.3%, which is less than that calculated for the transformation of **1** to 1/3Co_3O_4 (Δm_{theor} = 89.2%), the difference may be due to the impurities in the analyzed sample and thermolysis product. According to the IR spectroscopic analysis of the gases evolved at T > 270 ºC, CO_2, NH_3 and NO are formed.

4. Conclusions

Two novel mixed-ligand Ni(II) and Co(II) complexes containing the 1,10-phenanthroline are synthesized and characterized by single-crystal X-ray diffraction analysis. The compounds **1** and **2** are the mononuclear complexes which crystallize in the space groups $P2_1/c$ and $C2/c$, respectively. $[Ni(Phen)(H_2O)_3Br]Br$ (**1**) is the first of compounds containing $[Ni(Phen)(H_2O)_3Hal]^+$ cation, where Hal is a halogen atom. O—H···Br intermolecular hydrogen bonds (Table 3S, Fig. 2a) form a 2D plane network which by π–π stacking interactions between Phen ligands (Fig. 2Sa) are extended into a 3D network. All hydrogen atoms of all H_2O molecules are involved in hydrogen bonding. Each outer sphere Br^- ion is bound with four water

molecules from different $[Ni(H_2O)_3PhenBr]^+$ cations by O—H···Br1 hydrogen bonds. The coordinated Br^- ion forms two weak O—H···Br2 intermolecular hydrogen bonds. The Phen molecules are not involved in hydrogen bonding. The numerous intermolecular hydrogen bonds N—H···O, O—H···O and C—H···O (Table 3S) form a 3D net in $[Co(Phen)_2(H_2O)_2](Hba)_2{\cdot}2H_2O$ (**2**). The Hba^- ions form an infinite chain by N—H···O intermolecular hydrogen bonds (based on the $R_2^2(8)$ pattern) (Fig. 2b). Moreover, each Hba^- ion is connected with two $[Co(Phen)_2(H_2O)_2]^+$ cations by OW—H···O intermolecular hydrogen bonds and *vice versa*. The lattice water molecules unite the $[Co(Phen)_2(H_2O)_2]^+$ cations in an infinite chain by C_{Phen}—H···OW intermolecular hydrogen bonds (based on the $R_4^2(20)$ motif). Topological analysis using ToposPro program [15] showed that this 3D network is new. Similar to hydrogen bonding, the π–π interaction plays an important role in the structures **1**-**2** stabilization (Table 4S, Fig. 2S). The spectroscopic and thermal properties of compounds were analyzed.

Supplementary data

The crystallographic data (excluding structure factors) for the structural analysis have been deposited with Cambridge Crystallographic Data Centre (**1** – CCDC 1829122; **2** – CCDC 1829123). The information may be obtained free of charge from The Director, CCDC, 12 Union Road, Cambridge CB2 1EZ, UK (Fax: +44(1223)336-033, E-mail: deposit@ccdc.cam.ac.uk, or www: www.ccdc.cam.ac.uk).

Acknowledgements

The study was carried out within the public task of the Ministry of Education and Science of the Russian Federation to the Siberian Federal University (4.7666.2017/BP) in 2017-2019. X-ray data from single crystals were obtained with use the analytical equipment of Baikal Center of collective use of SB RAS and with use the analytical equipment of Krasnoyarsk Center of collective use of SB RAS.

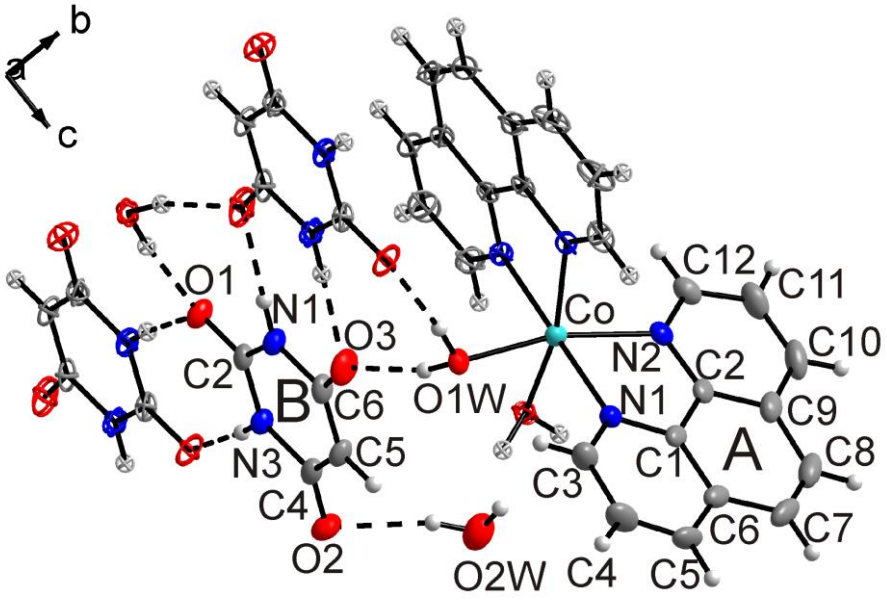
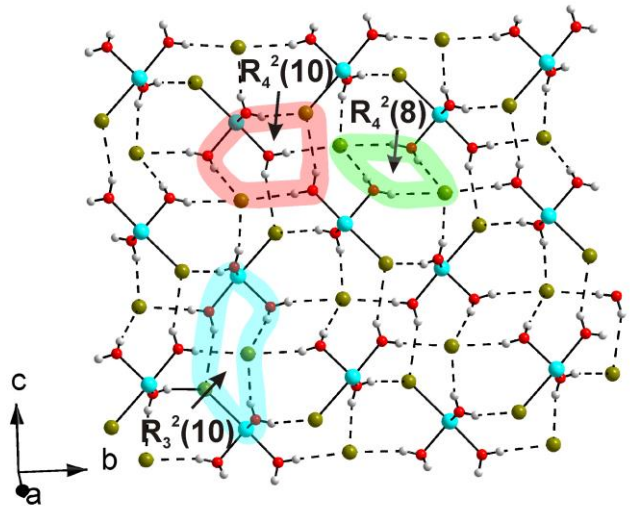
a)

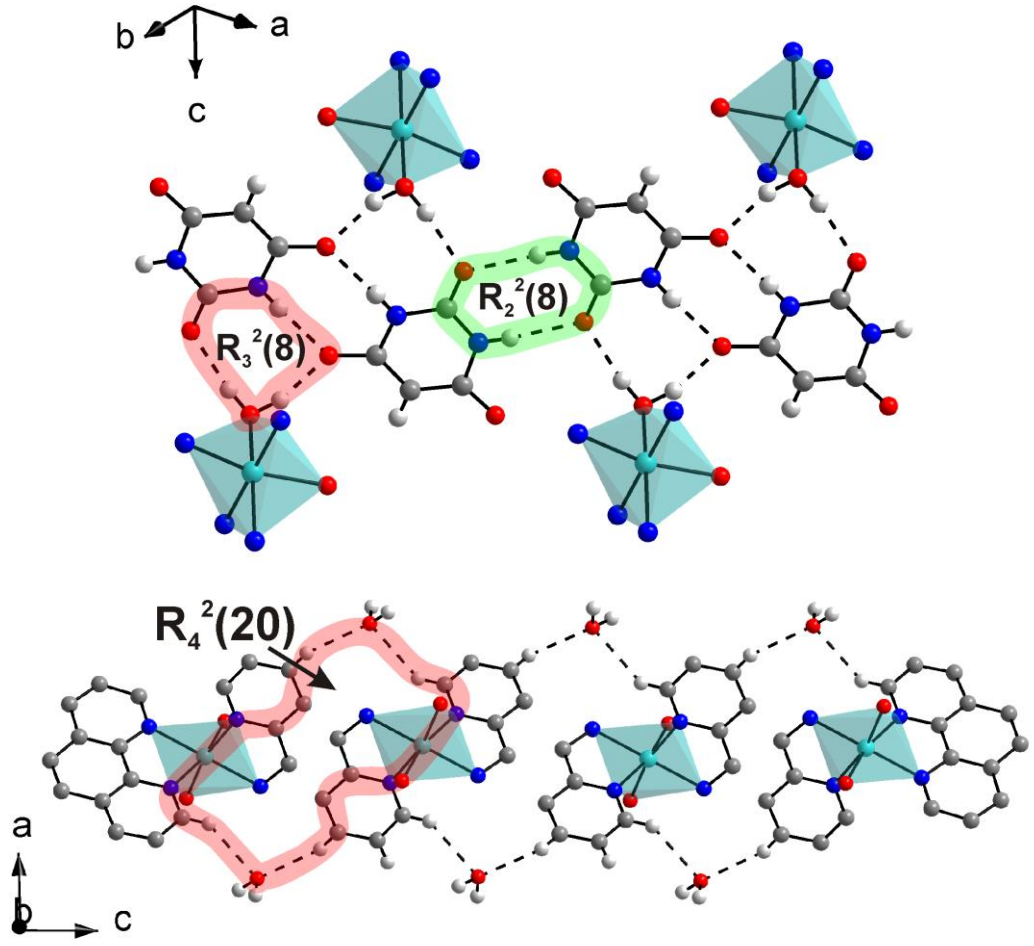


b)

Fig. 1 The asymmetric unit of the [Ni(Phen)(H_2O)$_3$Br]Br (a), [Co(Phen)$_2$(H_2O)$_2$](Hba)$_2$·2H_2O (b) unit cell. Symmetry independent, different molecules are marked by A, B labels. All atoms in the asymmetric unit are labeled. The neighboring symmetry-generated atoms are represented by principal ellipses with an individual color. The intermolecular hydrogen bonds are represented by dashed lines. The ellipsoids are drawn at the 50% probability level, except for the hydrogen atoms represented by spheres.



a)



b)

Fig. 2 Hydrogen bonding in **1** (a) and **2** (b). The H-bonds are marked by dashed lines, the H-bond motifs are marked by circles. The Phen molecules in (a), which are not involved in hydrogen bonding, were deleted to clarify the figure. Some H and C atoms were deleted to simplify the figure (b).

Table 4S. Parameters of the π–π interaction in **1** and **2**

Cg$_i$–Cg$_j$	d(Cg–Cg), Å	α, deg	β, deg	γ, deg	Cg$_i$_p, Å	Shift, Å
[Ni(Phen)(H$_2$O)$_3$Br]Br (**1**)						
Cg$_1$ – Cg′$_2$	3.732 (1)	2.52 (9)	24.6	26.9	3.3277 (8)	1.689
Cg$_2$ – Cg′$_2$	3.506 (1)	0.00 (9)	15.5	15.5	3.3780 (8)	0.939
[Co(Phen)$_2$(H$_2$O)$_2$](Hba)$_2$·2H$_2$O (**2**)						
Cg$_1$ – Cg′$_2$	3.7941 (9)	4.24 (7)	25.3	28.3	3.3409 (6)	1.798
Cg$_2$ – Cg′$_2$	3.7930 (9)	5.36 (7)	29.5	24.9	3.4393 (6)	1.599
Cg$_2$ – Cg′$_3$	3.6049 (9)	1.70 (7)	21.4	20.0	3.3883 (6)	1.231

(**1**): Cg$_1$ and Cg$_2$ are the center of two rings in Phen. Cg′$_2$ was obtained from Cg$_2$ by the transform (1–x, 1–y, 1–z). Cg$_i$_p is the distance between the center of the ring Cg$_i$ in the π–π interaction.

(**2**): Cg$_1$, Cg$_2$ are the centers of the rings in Phen, Cg$_3$ is the center of the ring Hba$^-$. Cg′$_2$ was obtained from Cg$_2$ by the transform (1–x, 2–y, 1–z), Cg′$_3$ was obtained from Cg$_3$ by the transform (x, 1–y, 1/2+z).
